

FM Gateway Data Center Information

For exceptional redundancy and superior technical hardware, FM Gateway proudly utilizes the facilities of two unparalleled datacenters: One Wilshire in Los Angeles, California and Marquisnet in Las Vegas, Nevada.

With 656,000 square feet of prime data center real estate, LA's One Wilshire has become the premier communications hub on the Pacific Coast and houses most of the world's most powerful networks. With cooling to support up to 150 Watts per square foot, redundant AC/DC UPS power, generator-backed power of up to 150 Watts per square foot, managed fire detection and suppression equipment, simply having your servers stored in One Wilshire nearly speaks for itself!

Marquisnet has recently emerged as one of the biggest and most intuitive data centers in the world. With multi-layer security control procedures, biometric palm entry, and motion-activated video surveillance, you can be sure your servers are in the most able hands in the world.

Adding to that uninterruptible redundant AC/DC power, Dual Backup Generators and electrical feeds, HVAC redundant air distribution under raised flooring for maximum temperature control, fire suppression, and even humidity control, Marquisnet is one number one choice for secure server housing.
